

# RED HOT 4Farmers prices help farmers beat Ryegrass Resistance

FARMERS should be considering alternative chemicals in their spraying strategy to beat herbicide resistant ryegrass.

4Farmers is slashing its prices on a selection of products to achieve this, which is particularly helpful if coming off a tough season.

4Farmers still has time to ship in the products below in time for the coming season. Get your orders in now. These specials will close 4th March or when stocks run out.

## Paraquat cheaper than Glyphosate prices!

*"Paraquat or Brown Out is a bargain at these price. Think about them instead of Glyphosate," Neil Mortimore 4Farmers GM.*

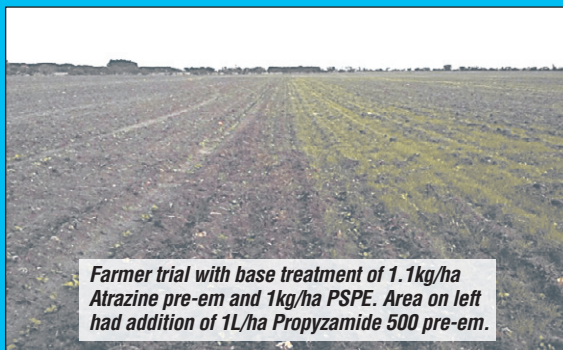

**PARAQUAT** at prices as low as **\$3.60/L ex GST** means it's cheaper than some Glyphosate prices.

There has never been a better time to consider rotating to Paraquat as an alternative knock down if weeds are small.

Resistance to Glyphosate is very serious but unfortunately the reality for some farmers. Protect Glyphosate and increase its longevity. At very least farmers consider using Paraquat in a "double knock strategy" in tandem with Glyphosate.

4Farmers also has BrownOut (Paraquat & Diquat mix like Spray.Seed®) at low prices too.

## PROPYZAMIDE ONLY AT 4FARMERS

*Farmer trial with base treatment of 1.1kg/ha Atrazine pre-em and 1kg/ha PSPE. Area on left had addition of 1L/ha Propyzamide 500 pre-em.*

**ONLY** at 4Farmers are you likely to get Propyzamide this season.

Field results for control of resistant ryegrass with Propyzamide have generally proved very good. Particularly if used early, conditions are moist, and also if in combination with other products like Atrazine.

**Prices as low as \$19.95/l exGST** makes Propyzamide a serious consideration. This price has been out there for some time but the window of opportunity is likely to close soon.

4Farmers is hopeful to widen registration past pastures into other crops like canola in the future if residue testing in harvested grain is satisfactory.

## Triallate, Metolachlor take pressure off Trifluralin

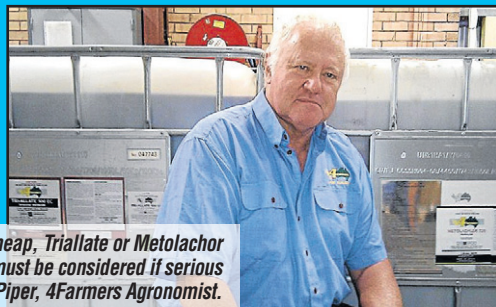

4FARMERS has been encouraging farmers to consider Triallate and/or Metolachlor in mixes with Trifluralin for pre-emergent cereal spraying.

Triallate is a Group J chemical and Metolachlor is Group K so getting away from Trifluralin that is a Group D chemical.

Why bother with Boxer Gold® or wait for Sakura® when combinations of the above chemicals give such comparatively good control and such good value.

Especially with prices for **Triallate as low as \$8.20/L exGST** and **Metolachlor \$5.95/L exGST** this alternative becomes even more attractive.

*"Especially this cheap, Triallate or Metolachlor combinations with Trifluralin must be considered if serious about resistance," Terry Piper, 4Farmers Agronomist.*
