

Don't let your forward planning become a gamble – after all, rust protection only costs \$4/ha!

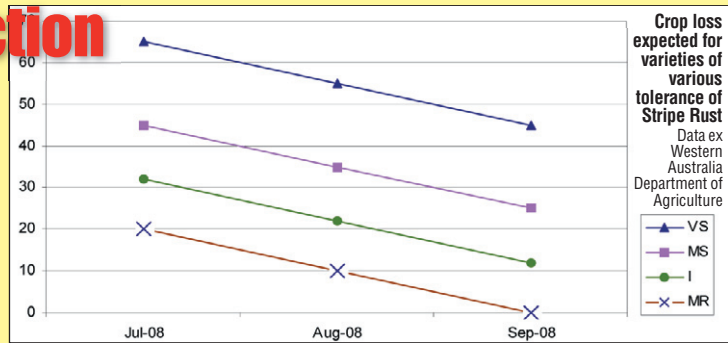

IT could be forward planning to decide that Rust won't be a problem this year, but then, it could also be a gamble.

Last week, 30% of 4Farmers purchases of Triadimefon 500 Dry was ordered by NSW farmers!

When there was a rust outbreak in NSW last year, Australia was without any fungicides for two weeks

After investing \$400/ha in growing a crop, saving \$4/ha on rust insurance sounds more like a gamble than forward planning.

Order your supplies now and don't take the risk of Australia running out again.

The graph outlines potential yield losses with Stripe Rust which can be expected with varieties of varying resistance to the disease. This data is for the Agzone 4. Varieties which are Very Susceptible (VS), Moderately Susceptible (MS), Intermediate (I), and Moderately Resistant (MR). Protection of more susceptible varieties requires a much more pto-active protection programme as the penalty for mistakes is greater.

The figures also factored in the time of infestation, either July, August or September, with even moderate resistant varieties showing a 20% yield reduction for a July infestation.

Adding extra kick to your Trifluralin

HOW resistance is your reyegrass to Trifluralin? 24% of WA ryegrass 6 years ago had some individuals showing signs of resistance to Trifluralin so it should be of concern to all farmers.

An effective strategy is not necessarily replacing Trifluralin but adding other products to it. Any of these solutions are vastly more cost effective than opting for comparable rates of say Boxer Gold®.

Some solutions and their approximate costing are;
 Trifluralin 480 1L/ha + Triallate 400 1L/ha **\$17/ha**
 Trifluralin 480 1L/ha + Metalachlor 720 1L/ha **\$16/ha**
 Trifluralin 480 1L/ha + Triallate 400 1L/ha + Metalachlor 720 1L/ha **\$26/ha**

The above rates are a general guide in situations with knife pints. Especially with Metalachlor crop damage is a risk. If sowing with full cut it is recommended people consider applying Metalachlor PSPE on a level seedbed.

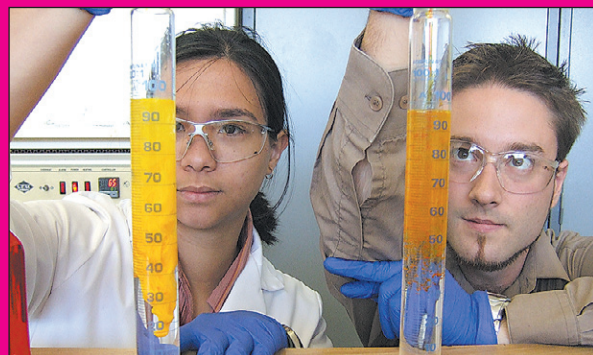

Please consult Terry Piper at 4Farmers to discuss your particular needs either at the office or 0427 563 445.

What Price is Quality?

LOOK how good it is! This photo from our lab with chemists, Stephanie Ketting-Oliver and John Miles proudly looking on shows: on the left the 4Farmers Trifluralin after being dropped into water and flowing into a lovely bloom without any agitation.

Contrast this against a competitor's product on the right. Whoever buys that product has to have good agitation and filters! Plus tolerate other problems it may have.

Quality that you buy with 4Farmers is worth money. When you buy 4Farmers it might not be the cheapest in some instances but it's likely to be the best value. That's what you want.
